

WHITEPAPER

CRON PROTOCOL

Contract Details

Name: Cron Protocol

Symboy: CRON

Decimals: 18

Total supply: 210.000.000

Max supply: 210.000.000

contract address:

What is Cron Protocol

CRON stands for **Cron Protocol**, commonly referred to as the **Four-Dimensional Coin**. In each transaction, **80%** is allocated to investors, **6%** is distributed among all holders, **5%** is burned, and **9%** is automatically added to the liquidity pool, with the coin being locked in a vault at a value equivalent to the coin itself for a term of three months. If an investor holds it for three months, they will not only gain significant returns but will also qualify for automatic payout as a bonus after the lock-up period ends.

While each transaction carries a 20% fee, in effect, this is around **5%**. The 5% burned and the 9% locked in the liquidity pool remain effectively under investor ownership. However, burning 5%, adding 9% to the liquidity pool, and locking coins in the pool for three months prevent investors from selling within a limited timeframe. Thus, as long as the price exceeds the purchase price, more investors will be attracted, meaning early investors can earn profits while new investors join, driving the price up. No one will be able to lower the price. Furthermore, with 5% burned on each transaction and 9% in the vault, the price will significantly increase, rewarding those who hold longer with more substantial gains.

CRON PROTOCOL

In effect, for a 5% fee, each investor will receive rewards, leading to a steady increase in coin investors. Consequently, their funds will grow on one hand, while the price rises on the other, allowing investors to multiply their profits. These features make the **Cron Protocol** unique and distinguish it from other cryptocurrencies. Let us illustrate what was explained to you earlier.

Set slippage to 25% during transactions.

Let us illustrate what was explained to you earlier. For example, if you invested \$100, a 20% fee would apply, leaving you with an investment worth \$80. This fee structure binds you to hold for a specific period. Out of the 20% fee charged, 6% has been distributed to all holders, 5% has been burned and its value added to Liquidity, and the remaining 9% is locked for three months, also enhancing Liquidity. Now, you too receive a share of the 6% distributed among all holders. Effectively, the actual fee is around 5%, as the remaining amount is sent to Burn and Locker, making you a holder of the asset if you retain it until the price rises, with the value kept securely in Liquidity as your deposit. The 14% charge isn't truly a fee but simply serves to keep you bound as a Holder.

If you continue to hold, you will not only securely regain the 14% (initially charged) in return but will also earn rewards from each transaction, replacing the 5% initially paid in fees and increasing your balance. The longer you hold, the greater the profits you'll accumulate.

It's important to clarify: do not invest in the Cron Protocol if you expect to get rich overnight. However, if you truly wish to accumulate wealth, then after investing, you must have patience. Those who are patient will receive far more than they expect, while those who lack patience will miss out on potential profits.

Price Impact

First, we need to understand what **Price Volatility** is and what causes the fluctuations in the price of a coin.

For example, if there are 100 coins and \$100 in the Liquidity Pool, the money in the pool will be divided by the number of coins, and the result will determine the price of one coin. If we divide \$100 by 100 coins (currently in liquidity), the result will be the price of one coin, meaning each coin is valued at \$1.

Now, if the number of coins in the Liquidity Pool increases while the amount of money decreases, this will cause the price to drop. Conversely, if the money increases in the Liquidity Pool while the number of coins decreases, the price will rise. This clearly indicates that for a higher price, an increase in money in the pool and a reduction in the number of coins are essential. If this occurs, the price can increase by 100%.

This is a distinctive feature of the **Cron Protocol**: its four-dimensional characteristics ensure a continuous price increase, facilitating the influx of money into the Liquidity Pool while minimizing the number of coins in the pool. This means that the price of the Cron Protocol today will never be the same as tomorrow; it may experience slight fluctuations but will continue to rise. In summary, over time, the price of the Cron Protocol will gradually increase and will not be able to fall.

At the same time, when investors invest, the price increases, and those who invested at lower prices believe they are making profits. When they sell simultaneously due to the price rise, it leads to a decrease in price, which frustrates investors and creates obstacles to the project's success. The success of a project can only occur if we do not allow the price to drop. The features of the **Cron Protocol** protect it from failure and provide a guarantee for its success.

CRON PROTOCOL

As soon as someone invests, they must wait until more investors join. The result will be more buy orders than sell orders. Therefore, no one can pull the price down, and the price will rise. Thus, the longer you hold, the greater your profits will be. Additionally, the 6% fee, 5% burned, and 9% locked away will fully support the price increase. The success of every project lies in continuous price growth, and the features of the **Cron Protocol** ensure its success.

The Cron Protocol is a lottery that will give you a 100% jackpot if you patiently hold on.

Holders and Introduction Policy

Holders who 'automatically stake' more will immediately receive 6% of the trading volume, and they can watch their wallets grow in real-time or increase the number of tokens by participating in staking before the pre-sale ends.

To promote the Cron community, there will be a pre-sale mechanism where you can introduce friends to earn major currencies like USDT and BNB. The multi-tier referral system includes F1 at 6%, F2 at 4%, F3 at 2%, and F4 at 1%. Rewards will be received in real-time as referrals contribute immediately.

Choose Binance Smart Chain for the Cron Protocol

By the way, the **Cron Protocol** could be launched on its own developed blockchain, but currently, for the common benefit, the **Binance Smart Chain** has been chosen. This is because most developers not only have expertise in it but also extensive experience.

Additionally, the security features and user-friendliness of the Binance Smart Chain perfectly meet the conditions of the **Cron Protocol**. That is why we have selected the Binance Smart Chain for the **Cron Protocol**.

Cron Protocol

Is it a meme coin?

The Cron Protocol is not a meme coin, and to understand why it is not classified as a meme coin, you need to know more about it first.

What is a meme coin?

Meme coins actually originated from the popularity of Dogecoin. The real meaning of a meme coin is a 'joke' that has no intrinsic value; it is a one-time joke. Therefore, those who take this joke seriously and invest in it will lose their investment.

There are two types of people who invest in meme coins: those who exploit them and those who lose their investments. Those who exploit meme coins understand that they are a joke and have no future. Due to a lack of knowledge, others compare them to Bitcoin, Ethereum, and other cryptocurrencies, believing that these coins were also very cheap initially, and after a few years, their prices soared. They think that if they had invested in them a few years ago, they would be millionaires today.

As a result, they feel they have missed an opportunity in the past, but if they invest in newly launched coins today, they might become millionaires over time. These individuals, lacking awareness, invest in meme coins expecting prices to skyrocket, as happened with Bitcoin in the past, believing that the same will happen with these meme coins. However, they are completely unaware of the fact that meme coins lack seriousness and are merely a joke regarding digital currency. They invest in it while treating it as a serious deal.

On the other hand, those with this knowledge fully exploit others' ignorance. They promote meme coins increasingly so that more people take this joke seriously and invest, thus becoming the owners of their investments.

At the same time, the promoters of meme coins buy large amounts of these coins at launch. As more people start investing, those who bought them cheaply or the owners of the meme coin realize that starting to sell their free supply is worthless, and they become the owners of everyone else's assets. After a few days, these meme coins prove to be a real joke, and those who invested in them regret it or try to console themselves with the mistake, believing that the price will rise one day or another, which is merely intentional deception.

What is the identity of a meme coin?

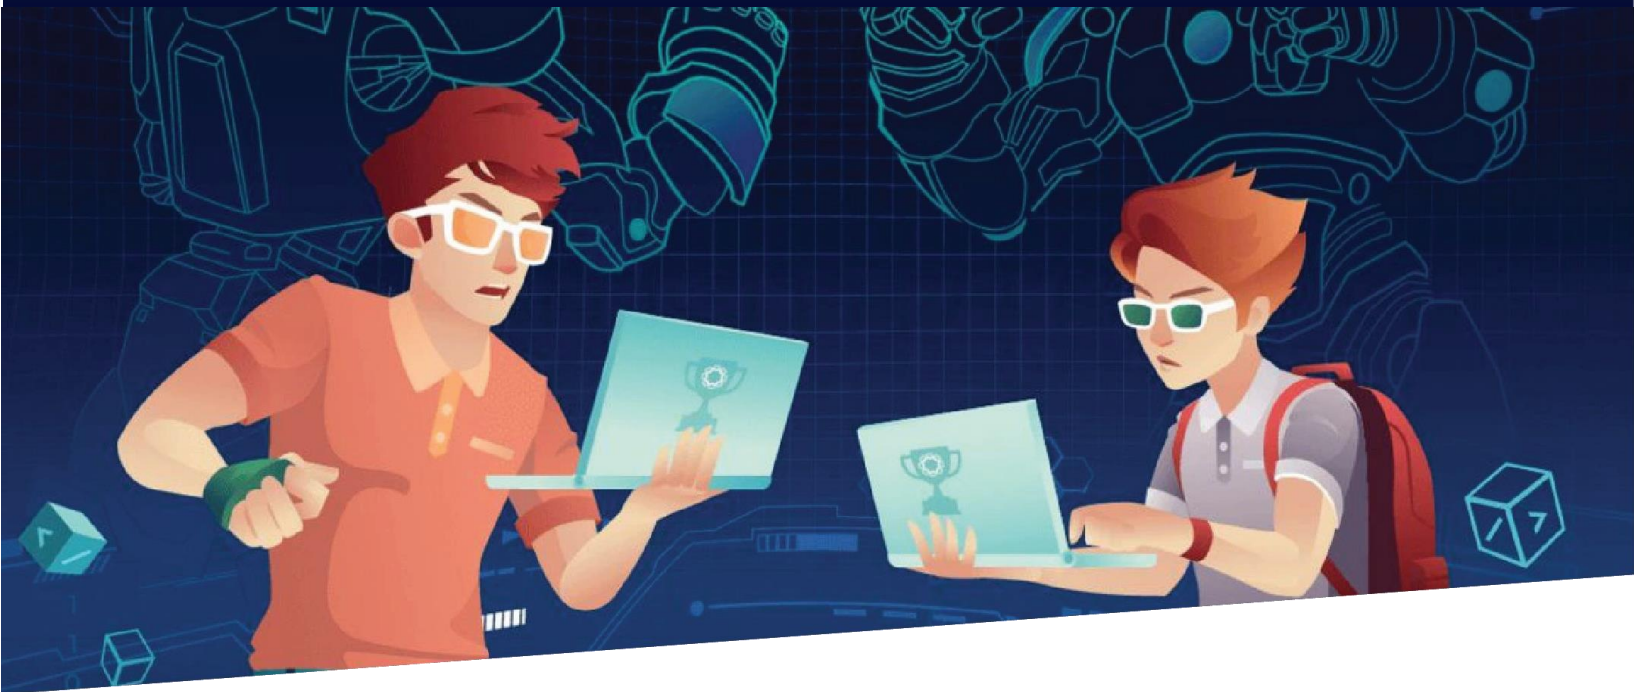

The easiest identification of a meme coin is its supply. Meme coins always have a massive supply, meaning that if any coin has a supply greater than 500 million, it is classified as a meme coin. The second identification of a meme coin is that at the time of launch, its price rises sharply, and then it never increases again, nor can it, because the holders have already capitalized at the time of launch. This is why the price increases at launch, and these capitalizers take the investors' funds and then no longer care about it. Therefore, these are very easy identifying features of meme coins based on which you can easily identify meme coins and keep your distance from them, as well as invest your funds in a safer coin.

Two factors must be considered before investing in any coin. The first factor is the supply; a lower supply will give hope for its upward movement. If a coin has more supply than usual, it is important to remember whether its contract has automatic burn features in each transaction. The presence of this function is not only essential but also must be fully functional, as this function will reduce its total supply with every transaction, and no one can prevent its price from rising.

Special steps have been taken in the **Cron Protocol** regarding automatic burns, and the amount of automatic burns is also being increased, ensuring that the total supply decreases as soon as possible so that the price can rise.

The initial total supply of the **Cron Protocol** is 210 million, which is not only very minimal but also, with each transaction, 5% of its supply will be burned until its total supply is reduced to a few hundred thousand or even a few thousand. This means that there will come a time when a **Cron Protocol** coin could be worth over \$100,000. These remarkable features of the **Cron Protocol** make it unique compared to all other types of digital currencies. The longer someone holds **Cron Protocol**, the more they can benefit, potentially gaining 100% returns.

Holding is gold.

The revolutionary coin circulation of Cron Protocol.

Reducing Coins and Continuously Increasing Prices.

When coins are circulated in trade equal to the total supply, 5% of the total supply will be burned, which will reduce the total supply by 5%. The same will happen when the second cycle begins; this will not only further reduce the supply by 5% but also signify the completion time of the cycle.

Therefore, in each cycle, the supply will not only decrease by 5%, but the price will continuously rise.

After completing every cycle of coin circulation, 5% of the supply will be burned, which means that 5% of the total supply will be eliminated. This will not only lead to a stable price but will also increase, meaning that the price before the total supply is now the minimum price of the reduced supply by 5%.

For example, if the total supply is 100 coins and its value is \$100, meaning each coin is worth \$1, then after completing a cycle of coin circulation, not only will 5% of the supply be reduced, but there will only be 95 coins left out of 100, and now the price of 100 coins will equal 95 coins, meaning that a coin worth \$1 now has a value of \$1.05 after completing the circulation cycle. Currently, the total supply is reduced to 95 coins, so after completing the second cyclical phase, the current total supply of 95 coins will decrease by another 5%. This means that we now have 90.25 coins in the total

supply and its minimum value is \$100.

This means that each coin has a minimum value of \$1.10.

When the coin circulation cycle is completed, the supply in each cycle will decrease, and the price will increase.

Even if the total supply decreases from 100 coins to 1 coin, one coin will have a minimum value of \$100, meaning that if someone bought a coin at that time when it was worth \$1 and held it until the supply reached 1 coin, then that one coin will have a minimum value of \$100.

Holding is gold.

What is a coin circulation cycle and how does it work?

When the coins are in circulation and the number of circulating coins equals the total supply, a coin circulation cycle will be completed. Upon completion, 5% of the total supply will be burned, and 5% will also be reduced.

For example, if the total supply is 100 coins, it is not necessary for all 100 coins to be in circulation. However, if a coin is circulated 100 times, then the number of circulating coins will equal the total supply, meaning one cycle has been completed.

It is not necessary to rotate the total supply to complete the coin circulation cycle, but the more the supply is circulated, the more coin circulation cycles will be completed, and the total supply will decrease to a minimum level.

Coin Circulation Cycle Chart

Start your journey with Cron Protocol (CRON).

Our challenging goal is to achieve 100 cycles. When we reach 100 cycles, the minimum price of one Cron Protocol coin will be \$100,000. That is why it is a revolutionary lottery coin, Cron Protocol.

The term of the liquidity lock and its further expansion.

Currently, the liquidity lock duration of Cron Protocol is 5 years. Once this duration is completed, the term will be extended.

Security Features

- ✔ Contract has been verified
- 📄 Contract has been audited
- 🔒 Liquidity locked (5 years)
- 🪙 (R) Non-mintable supply
